Bytes per committed transaction in the peer block file: ECDSA → ML-DSA-44 (total 5,467 B → 32,824 B)
Block (stored on every peer)
Transaction envelope (one per transaction)
Payload header
channel header + client identity (PEM)
1,136 B → 6,007 B
Action header
client identity again (PEM)
1,022 B → 5,893 B
Proposal payload
chaincode, function, the alert itself
160 B → 160 B
Proposal response payload
proposal hash, read/write set, response
780 B → 780 B
Endorser identities (peer0.org1, peer0.org2)
two PEM certificates, one per endorsing organisation
1,966 B → 11,704 B
Endorser signatures (x2)
141 B → 4,839 B
Envelope signature (client)
71 B → 2,420 B
Block metadata (share per transaction)
orderer signature and identity, transaction validity flags
117 B → 849 B
